Documentos de Arqueología Medieval

Esta colección de monografías tiene como fin editar estudios, actas de encuentros, tesis o memorias de excavación en el campo de la Arqueología y la Historia Postclásica siguiendo criterios de calidad. Todos los textos publicados han sido revisados por evaluadores externos siguiendo protocolos en uso en las revistas referenciadas. Se aceptan textos en distintos idiomas, y solamente se publicarán trabajos inéditos. El Comité Científico está formado por los siguientes investigadores:

Alberto García Porras (Universidad de Granada)
Alejandro García Sanjuán (Universidad de Huelva)
Alfonso Vigil-Escalera Guirado (Universidad de Salamanca)
Andrew Reynolds (University College London)
Catarina Tente (Universidade Nova de Lisboa)
Giovanna Bianchi (Università degli Studi di Siena)
Helena Catarino (Universidade de Coimbra)
Helena Kirchner Granell (Universitat Autònoma de Barcelona)
Igor Santos Salazar (Università degli Studi di Trento)
Iñaki Martín Viso (Universidad de Salamanca)
Jorge Alejandro Eiroa Rodríguez (Universidad de Murcia)
José Avelino Gutiérrez González (Universidad de Oviedo)
Juan Antonio Quirós Castillo (Universidad del País Vasco/Euskal Herriko Unibertsitatea)
Juan Carlos García Armenteros (Universidad de Jaén)
Julio Escalona Monge (Consejo Superior de Investigaciones Científicas, Madrid)
Margarita Fernández Mier (Universidad de León)
Olatz Villanueva Zubizarreta (Universidad de Valladolid)
Santiago Castellanos (Universidad de León)

Resumen

Este libro es el primero de una serie de volúmenes colectivos dedicados al estudio de los campesinados preindustriales en la Península Ibérica y otros espacios europeos desde la Historia y la Arqueología Social. Esta temática conoció un importante auge a lo largo del siglo xx, pero ha decaído progresivamente en los últimos decenios en el marco de las renovaciones teóricas que caracterizan el giro posmoderno y la caída del telón de acero. No obstante, la emergencia de una nueva arqueología rural y del campesinado, la creciente atención a los paisajes culturales, la renovación de la historia social europea y las profundas consecuencias que ha tenido la crisis financiera de los años 2007-2008 han creado las condiciones para interrogarse acerca de la vigencia de esta temática, así como analizar los nuevos enfoques teóricos y metodológicos que se están utilizando. Adoptando una innovadora perspectiva diacrónica, estos volúmenes recogen algunas de las principales aportaciones que se están realizando en torno al estudio del campesinado preindustrial desde una perspectiva interdisciplinar. Este primer libro de la serie se ocupa del campesinado desde la prehistoria hasta la edad media desde una perspectiva preferentemente arqueológica.

Laburpena

Liburu hau iberiar penintsulako eta beste hainbat esparru europarretako industriaurreko nekazalgoa Historia eta Arkeologia sozialaren ikuspuntutik ikertzen duten liburuki kolektiboz osatutako bildumaren lehenengo alea da. Gai honek une gorena bizi izan zuen xx. mendean zehar, baina azken hamarkadatan etengabe garrantzia galdu du bira postmodernoa eta altzairuzko oihalaren erorialdia bereizten duten berrikunta teorikoen testuinguruan. Hala ere, landa- eta nekazalgoaren arkeologia berriaren sorrerak, paisaia kulturalei emandako gero eta arreta handiagoak, historia sozial europarraren berrikuntzak eta 2007-2008 urtetako finantza-krisiaren ondorio latzek, egoera prestatu dute gai honen indarra berriz jorratzeko, eta baita bere ikuspuntu teoriko eta metodologiko berriak ere. Ikuspegি diakroniko berritzalea hartuz, liburuki hauek nekazalgoari buruzko ikerketak bereizten dituzten ikuspuntu teoriko eta metodologiko berriak lantzen dituzte diziplinarteko ikusmolde batean oinarrituta. Lehenengo liburuki honen gaia aurrehistoria eta erdi aroaren arteko nekazalgoa da, batez ere ikuspegি arkeologikotik.

Abstract

This book is the first in a series of collective volumes devoted to studying pre-industrial peasantries in the Iberian Peninsula and other European spaces from History and Social Archaeology. This theme experienced a major boom throughout the twentieth century but has progressively declined in recent decades within the theoretical renewal that characterized the postmodern turn and the fall of the Iron Curtain. However, the emergence of a new rural and peasant archaeology, increasing attention to cultural landscapes, the renewal of European social history and the profound consequences of the 2007-2008 financial crisis have created the conditions to question the validity of this topic, as well as to analyze the new theoretical and methodological approaches being used. Following an innovative diachronic perspective, these volumes explore the renewed theoretical and methodological perspectives that characterize pre-industrial peasantry studies from an interdisciplinary perspective. This first book in the series deals with peasantry from prehistory to the Middle Ages from a preferably archaeological perspective.

Riassunto

Questo libro è il primo di una serie di volumi collettivi dedicati allo studio del mondo contadino in epoca preindustriale nella Penisola Iberica ed in altri spazi europei a partire dalla prospettiva della Storia e della Archeologia Sociale. Questa tematica ha conosciuto un certo interesse nel corso del secolo xx, decadendo progressivamente al finire del secolo stesso, nell'ambito dei rinnovamenti teorici che hanno caratterizzato la svolta postmoderna e la caduta della cortina di ferro. Ciononostante, l'emergere di una nuova archeologia rurale e del mondo contadino, la crescente attenzione ai paesaggi dal punto di vista culturale, il rinnovamento della storia sociale europea e le profonde conseguenze che ha avuto la crisi finanziaria degli anni 2007-2008 hanno creato le condizioni per interrogarsi sulla validità di questo problema, nonché sulle prospettive utilizzate. Adottando una prospettiva diacronica innovativa, questi volumi esplorano i rinnovati approcci teorici e metodologici che caratterizzano gli studi del mondo contadino preindustriale da una prospettiva interdisciplinare. Questo primo libro della serie si occupa del mondo contadino dalla preistoria al medioevo a partire da un punto di vista principalmente archeologico.

Resumé

Ce livre est le premier d'une série de volumes collectifs consacrés à l'étude de la paysannerie préindustrielle dans la Péninsule Ibérique et dans d'autres espaces européens du point de vue de l'Histoire et de l'Archéologie Sociales. Cette thématique a connu un important développement au cours du xx^e siècle, mais elle est ensuite déclinée progressivement dans les dernières décennies, dans le cadre des renouvellements théoriques qui caractérisent le virage postmoderne et la chute du Rideau de Fer. Cependant, l'émergence d'une nouvelle archéologie rurale et de la paysannerie, la croissante attention aux paysages culturels, le renouvellement de l'histoire sociale européenne et les profondes conséquences de la crise financière des années 2007-2008, ont créé les conditions appropriées pour se demander autour de la validité de cette thématique, ainsi que sur les nouvelles approches théoriques et méthodologiques employées. Tout en adoptant une innovatrice perspective diachronique, ces volumes ont le but d'explorer ces nouvelles approches qui caractérisent les études de la paysannerie préindustrielle depuis une perspective interdisciplinaire. Ce premier livre de la série s'occupe de la paysannerie depuis la Préhistoire jusqu'au Moyen Âge, adoptant de préférence une perspective archéologique.

Preface

The series titled “Archaeology and History of the Peasantries. From the Late Prehistory to the European Common Agriculture policy” published in the collection “Documents of Medieval Archaeology” is one of the main results of the research project ‘Peasantry Agency and Sociopolitical Complexity in North-western Iberia in Medieval Ages’ funded by the Ministry of Economy and Competitiveness within the National Plan for R&D, as part of the Research Challenges in 2016. This project is part of a broader initiative consisting of four coordinated subprojects entitled ‘Local spaces and social complexity. The medieval roots of a 21st century problem’, which intends to understand the current rural communities in Southern Europe as heirs to a historical process of management and exploitation of local space dominated by the persistence of forms of collective organization in a permanent cooperative/conflict relationship with external actors of all kinds. One of the first axes in order to address this issue is, necessarily, to consider the genealogy of these historical subjects from a variety of approaches.

The main objective of this series is to explore the new theoretical and methodological approaches that characterize historical and archaeological studies of pre-industrial peasantries developed in recent years in the Iberian Peninsula and other European spaces. This theme experienced a major boom throughout the twentieth century, but has progressively declined in recent decades as a result of the theoretical renewal that characterized the postmodern turn, the fall of the Iron Curtain and, more generally, the progressive marginalization and disappearance of peasantry in favour of farmers embedded in a capitalist logic (RODRÍGUEZ BECERRA, MACÍAS SÁNCHEZ 2009). However, the emergence of a new archaeology of peasantries and rural areas, the recent renewal of social history in Europe and the profound consequences of the 2007-2008 financial crisis have created the conditions to question the validity and usefulness of this topic, and even this category of analysis. Increasing attention to cultural landscapes, processes of heritage of the rural environment, progressive erosion of collective identities through practices such as the registration of religious property or communal property appropriation and expropriation are some of the milestones that today characterize our capitalist society, culturally urban and generating forms of commodification, marginalization and subalternisation of societies and rural environment. Paradoxically, not only do peasants remain a majority on the planet, but their numerical entity has increased significantly in recent decades, particularly in Africa and Asia. But in addition, there are specialists who have not hesitated to underline the relevance that the processes of “re-peasantification” of rural areas are having in Europe and the West (PLOEG 2008) or the centrality that peasant cultures will have in the future in order to achieve forms of “sustainable development” in an era marked by the climate crisis (PÉREZ-VITORIA 2005), as highlighted at the recent COP25 World Climate Summit in Madrid. (<https://www.cop25.cl/#/>).

Being aware of the complexity of such intellectual challenge and aiming to avoid the more than common tendency to academic fragmentation with which Humanities address present societies challenges, on this occasion it has been decided that an innovative path in a triple direction is to be followed. First, a diachronic and long-lasting approach has been prioritized. Efforts to study peasants over different historical periods are not very frequent (ROSENER 1994; SCOTT 1998; TAUGER 2011), which makes it difficult to question the assumptions of each academic area or community. Secondly, there have been a diversity of researchers involved all of whom share an interest in new social history and are developing new theoretical and methodological proposals. Thirdly, although the focus of the project is located on the Iberian Peninsula, significant comparisons with other European territories under study have been made.

This first volume of the series deals with peasantries from prehistory to the Middle Ages from a preferably archaeological perspective. Some of the chapters that make up this volume were presented at a scientific meeting held at the Faculty of Arts of the University of the Basque Country in Vitoria-Gasteiz

in October 2018. However, the text does not include the final conclusions of the colloquium as such, since there are contributions which have been incorporated and, on the other hand, other texts have been published in other sites (PINAR 2017; DAVIES 2019). In conclusion, we must express our sincere thanks to all the people and institutions that have participated in the creation of this volume, starting with all the authors, the reviewers of the originals, the Faculty of Humanities and the Department of Geography, Prehistory and Archaeology of the University of the Basque Country / Euskal Herriko Unibertsitatea.

Do we need an archaeology of peasantries? A new look at rural history (in the light of the Iberian experience)

JUAN ANTONIO QUIRÓS CASTILLO

ABSTRACT

In this volume it is argued that the new archaeological studies that are being carried out around pre-industrial peasantry represent a factor of profound renewal in rural history. This introduction first discusses the context in which an archaeology of peasantry in the Iberian Peninsula and other European spaces has emerged in recent decades. Secondly, it intends to transcend traditional academic fragmentation and prioritize the study of the historical evolution of the social landscape over the analysis of the usual research topics. Then, the main contents of the volume are presented, focusing on the different theoretical and methodological approaches used by the authors. The nine chapters in the volume analyze peasantry between protohistory and the Middle Ages from three main thematic axes: social complexity, peasantry agency, and economy and land use. Finally, in the light of these contributions a general characterization of peasantry archaeology in Iberia over the last decade is carried out, showing the main trends studied and their strengths and weaknesses. The introduction concludes by suggesting some proposals for the future.

KEYWORDS: Rural history, Peasant Studies, Political economy, Anthropology, Sociology, Iberia, *Longue durée*, Landscape Archaeology.

1. INTRODUCTION

Despite the fact that the ‘Journal of Peasant Studies’ or the ‘Journal of Agrarian Change’ are ranked amongst the most cited academic journals in Anthropology, Cultural Studies or Arts and Humanities according to SJR (Scimago Journal and Country Rank)¹, it is not hard to say that

peasant studies are considered by most historians and archaeologists as an old-fashioned subject, and that peasant studies have faded away from academic research agendas over the last two decades (BORRAS 2009, p. 17). Indeed, many scholars avoid the term peasant or peasantry, calling them non-elite, commoners, farmers, lower classes, dwellers, etc. and an explicit refusal of peasantry as a historical or archaeological subject can sometimes be found in recent academic production (THEUWS 2010; BLAIR 2018; SABLOFF 2019).

Obviously, this is an oversimplification, and some historians and archaeologists have been recently working on the study of peasantry. In archaeological terms Chris Loveluck’s work ‘Northwest Europe in Early Middle Ages, c. AD 600-1150’ pays attention to the elite as well as peasantry, middle groups, artisans and traders (LOVELUCK 2013). Another influential work is Chris Wickham’s monumental study ‘Framing the Early Middle Ages. Europe and the Mediterranean, 400-800’, where he defines a peasant mode of production in order to analyze the dynamics of rural social landscapes (WICKHAM 2005). However, the main intellectual references of Wickham’s model date back to the 1960s and 70s, in the works of Marshall Sahlins, Ester Boserup and Claude Meillassoux (BOSERUP 1965; SAHLINS 1972; MEILLASSOUX 1975). In sum, it seems that discontinuity may exist between the ‘golden age’ of historical and archaeological peasant studies in the 1960s to 80s and present research.

Indeed, the two graphs in Figure 1 illustrate this tendency. Both curves have been obtained using the Google Books Ngram tool. This is an online search engine that plots the frequencies of any term using a yearly count found in Google's text *corpora*. In the first curve, reflecting English-language production, references to 'peasants' become frequent from the 1930s onwards to suffer a dramatic and progressive numerical reduction from the 1970s. In contrast, the curve for Spanish-language production shows a progressive increase in the term 'campesinos'

from the 1960s, reaches its maximum frequency between the 70s and 90s and declines markedly after the end of the century.

Even though the limitations of this diagnostic tool have to be taken into account, both curves show clear trends in the vigor of this topic in scientific production in two directions: on the one hand, there is a difference between Anglo-Saxon and Hispanic academic cultures since the fall of the Berlin Wall; on the other hand, studies on peasantry have contracted significantly in recent decades.

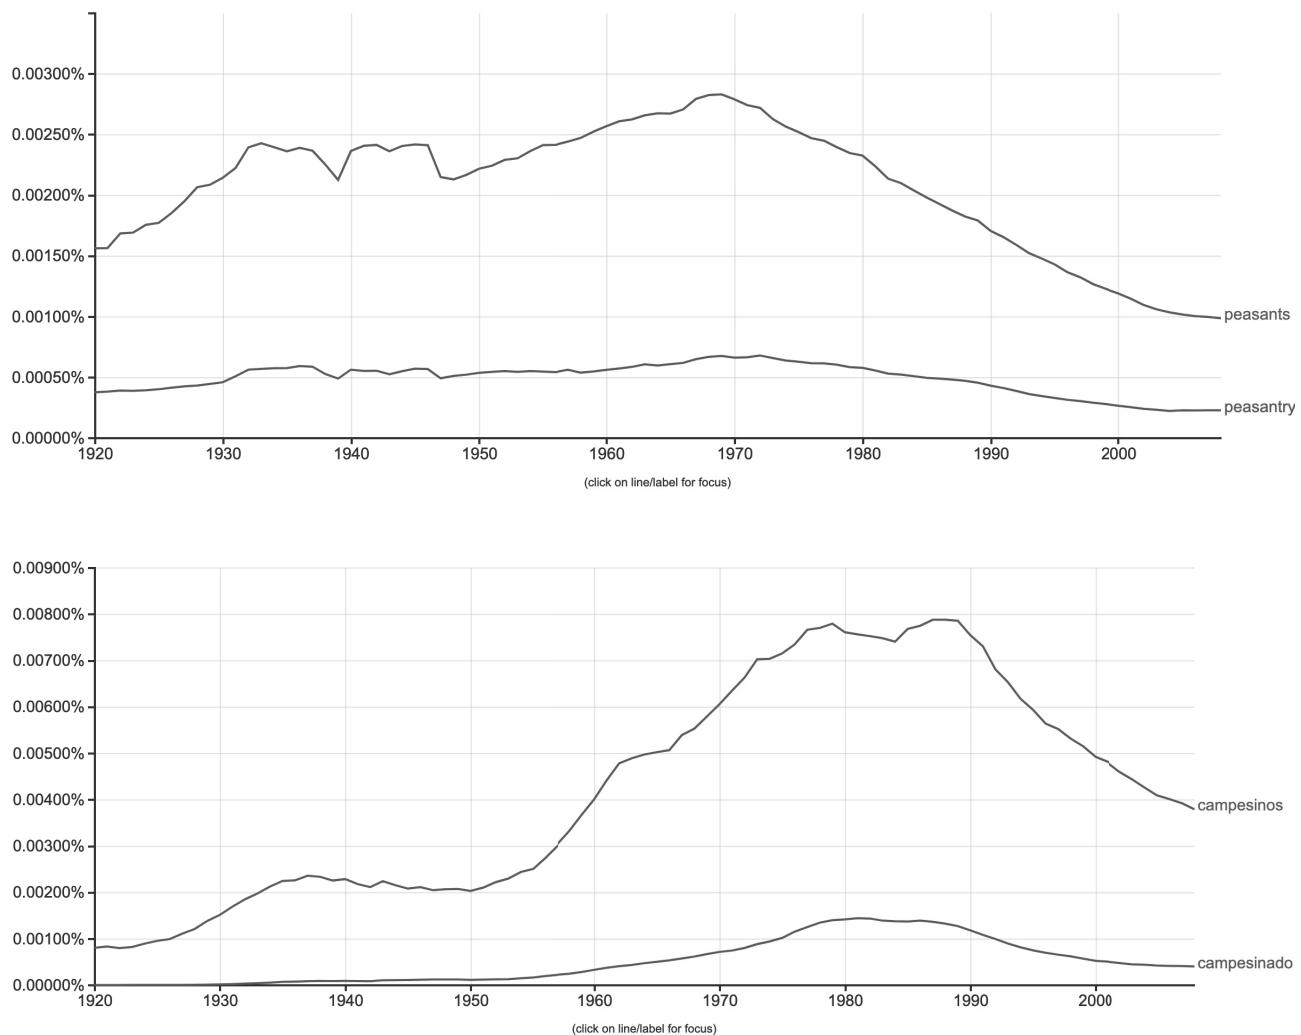

Figure 1.1. Frequency of the words 'peasants' and 'farmers' in bibliographic production in English and Spanish between 1920 and 2008 according to Google Books Ngram.
